

# **XP Core Values and How the Team Followed Them**

## **1. Communication**

The team ensured seamless communication throughout the development of the RestaurantFinder application. They used tools like GitHub, Slack, and video conferencing to stay aligned. Weekly scrum meetings were held to discuss progress, challenges, and upcoming tasks, ensuring transparency and collaboration. Clear documentation of APIs, database structures, and user stories helped all team members understand their roles and the project as a whole. Team members also shared frequent updates in the project journal, ensuring accountability and avoiding miscommunication.

## **2. Feedback**

Feedback was central to the project's iterative development process. Regular code reviews helped improve the quality of APIs and UI design while catching errors early. End-user testing sessions allowed the team to identify pain points in the user experience and refine features such as search functionality and map integration. Retrospectives were held at the end of each sprint, where team members provided constructive feedback on processes, enabling continuous improvement in collaboration and task management.

By actively fostering communication and integrating feedback, the team ensured the RestaurantFinder application met its functional requirements while maintaining a high standard of quality and efficiency.
